basic steps

Creative at home

Auto White Balance

Tap on the AW button to instantly adjust the white balance. Your image may brighten or darken creating a better look. Tap on the check-mark when you are satisfied with your image.

WB balances the color temperature in your image. How does it do this? It adds the opposite color to the image in an attempt to bring the color temperature back to neutral. Instead of whites appearing blue or orange, they should appear white after correctly white balancing an image.

Sharpening the photo

Image sharpening is an effect applied to digital images to give them a sharper appearance. Almost all lenses can benefit from at least a small amount of sharpening.

The Sharpening tool often reduces the quality of your image by introducing grain.

If you do use Sharpening, use it in moderation.

Cropping option

To crop a photo, simply hold down your fingers and move inwards until you receive the desired look.

Cropping removes distracting elements or empty space from the edges of the frame. It can also improve composition and emphasize the essential aspects of the photo.

In the Snapseed Tools, tap Crop. Select an aspect ratio, e.g. Original, Square, 4:3, etc. Or select Free if you prefer to crop without being restricted to particular dimensions.

RGB

Use curves to add different levels of contrast to your image, remap white and black levels, tweak highlights and shadows, as well as significantly manipulate color values.

The individual channels work as follows:

The Red curve tones the picture either towards red or towards its opposite, turquoise.

The Green curve tones the picture either towards green or towards its opposite, magenta.

The Blue curve tones the picture either towards blue or towards its opposite, yellow.

The RGB curve changes the photo's overall brightness and contrast.

The Brush

The brush tool gives you ultimate control over selectively adjusting brightness and color. perfect for photos where different parts of the scene need brightening or darkening

Use your finger to brush over the areas you want to adjust

If you don't see the brush tools beneath your image, tap the Brush icon at the bottom of the screen.

Select the Dodge & Burn brush to brighten or darken certain areas of your photo.

To see which areas you've adjusted, tap the Eye icon. Any areas that you've brushed over appear highlighted in red.

If you made a mistake, you can erase your edits. Tap the up or down arrows until the value is set to Eraser. Then brush over the red areas to remove your edits. Switch off the Eye icon to hide the red highlight.

Straighten angle +1.90°

Rotation

To rotate your photo manually, drag your finger over the image. Use the gridlines to help you get the image straight

When you rotate a photo, the tilted edges get cropped. Check that you're not going to lose any important elements from the edges of the frame. If you're happy with the edit, tap the checkmark.

STYLES

TOOLS

Healing

select the Healing tool and tap on the object which you want to remove. The app will effectively cover up it with patches from nearby areas.

Creative at home

Filters

Grain Add natural-looking grain to the image. A value of 0 will ensure no grain is added.

Style Strength Increase or decrease the effect of the chosen style.

A value of 0 will ensure no additional style is added, allowing only grain to be applied.

HDR

- **The purpose of the HDR Scape tool is to bring out as much detail as possible in the photo**
- **HDR Scape is a powerful tool but please use it with caution. If you over-do the HDR effect, you can end up ruining your image. HDR Scape will try to aggressively brighten the shadows, which will introduce noise**

Text

- **Adding text option lets you choose the font, colour and the size of the text you want to write**
- **You can then tap on the text and move it anywhere on the picture**
